

AOD-9604

ANTI-OBESITY DRUG

(Injectable)

The peptide AOD-9604 was developed in the 1990s by molecular biologist Frank Ng, a professor at Monash University in Australia. Professor Ng sought to develop an anti-obesity drug with the same remarkable fat burning effects of human growth hormone (HGH), but without the possible side effects. The result was AOD-9604. Simply put, AOD-9604 is the part of HGH that's responsible for fat loss.

AOD-9604 stimulates the breakdown of body fat (lipolysis) and inhibits the formation of new fat (lipogenesis) particularly around the abdomen. In short, it mimics the way our natural growth hormone regulates fat metabolism. The result is greater weight loss in a shorter period of time without the negative effects that some individuals experience when using HGH or other weight loss protocols.

Not unlike growth hormone, AOD 9604 injections should be administered subcutaneously. Users typically start to see results at 12 weeks, however, working out regularly and following a low-calorie diet can accelerate the weight loss process.

This peptide has an excellent safety profile having received GRAS status (generally recognized as safe) from the U.S. Food & Drug Administration based on expert review.

In addition to its fat-burning ability, AOD 9604 possesses many more of the regenerative properties associated with HGH and is currently being studied as a potential treatment for hypercholesterolemia, bone and cartilage repair, osteoporosis and osteoarthritis.

This remarkable peptide is a great option for those who are looking for a safe and affordable alternative to help them achieve their weight loss goals. And the best part, AOD 9604 does not require the Insulin Tolerance Test needed for a physician to legally prescribe Human Growth Hormone.

AOD-9604

THE FAT BURNER

AOD-9604 not only stimulates the breakdown of body fat, but also inhibits the formation of new fat particularly around the abdomen.
