Estro Flush

(120 Capsules)

Why Estro Flush?

“Free testosterone” is the testosterone that is responsible for all the benefits we enjoy when we’re on a hormone replacement therapy program.

Estro Flush can help eliminate some of the estrogens, allowing for more “Free Testosterone”.

Free Testosterone is a term that refers to the amount of available testosterone in your blood. The remaining testosterone is “bound” by a protein known as SHBG, so it is unavailable for your body to use. More Estrogen means more SHBG and more SHBG means less Free Testosterone.

Along with prescribed medications, any comprehensive testosterone replacement therapy should include a supplement that will help reduce the level of estrogens in the body. Estro Flush does just that!

For women, it’s important to balance estrogen and progesterone, and eliminate carcinogenic estrogen metabolites. Estro Flush aids women in avoiding estrogen dominance and helps make their current hormone program more effective. Bottom line, this product can be helpful in mitigating the risks associated with excess estrogen.

Diindolylmethane (DIM) is an advanced metabolite of Indole-3-Carbinol (I3C), the indole found in cruciferous vegetables like broccoli, cabbage and cauliflower. Indoles promote healthy estrogen metabolism and an optimal ratio of estrogen metabolites. The added BioPerine® and curcumin augment the bioavailability, degree of absorption and concentration of the bioactive curcuminoids in the bloodstream. *

Estro Flush

An essential addition for anyone who wants to achieve the maximum results from their hormone therapy.

Our Extreme Performance supplements are produced with only the highest-grade products under strict quality controls.
